Benchmark Requirements

Domain: Overleaf / LaTeX (scholarly publishing)
Asset: Florula Aramiensis Benchmark Asset
Task: Resolve the four open curator's remarks in a 44-page multi-file LaTeX flora so that it is correct and compiles cleanly.

Required project content

- A `book`-class LaTeX project with a house style (`florula.sty`), front matter, three introductory chapters, eight family chapters, three appendices and a BibTeX bibliography.
- Four tab-separated data files (18 species, 12 localities, 90 specimens, monthly phenology) that are the single source of every count, date, locality and map in the book.
- Eighteen species treatments, each citing its specimens and showing a distribution map drawn from the data.
- A Key to Families and seven keys to species.
- A review log, a register of open questions and two build files.

LaTeX requirements

- Compile with pdfLaTeX and BibTeX (natbib, plainnat).
- Keep the project editable as UTF-8 LaTeX source in its existing folder structure, with every chapter file connected through `main.tex`.
- Use the existing references; every one of the 15 references must be cited.

Acceptance thresholds

Criterion	Threshold
LaTeX errors / undefined references / overfull boxes	0 / 0 / 0
Compiled page count	44 (±0)
Specimens violating the six data rules	0 of 90
Specimens cited exactly once in their own treatment	90 of 90
Distribution maps and phenology statements agreeing with the data	18 of 18 each
Phenological calendar cells agreeing with the data	216 of 216
Key to Families	couplets 1–9, all 8 families reachable
Author abbreviations used but not listed in Appendix A	0
Review-log entries closed with a resolution	12 of 12
Frozen files changed (including both decoys)	0 of 26
Verifier score of the final state	1.0000

Expected final state

- The state in `golden_solution/`: all four planted defects corrected, the review log closed, and the compiled 44-page PDF.
- The decoys `data/archive/specimens_export_2023.tsv` and `notes/house_style_2019.md` present, unchanged and unused.
- The five-milestone history preserved in the milestone folders and in one git commit per milestone.

Important: the region, localities, collectors, herbaria and specimen records are synthetic and demonstrative. They must not be presented as evidence from real collections.
